Car Sales Analysis Dashboard (Excel Project)

📌 Project Overview

This project focuses on analyzing car sales data using **Microsoft Excel**, where I created interactive **pivot tables and visualizations** to extract meaningful business insights.

The goal of this project is to understand sales performance, identify top-performing models, and evaluate profit trends to support data-driven decision-making.

📊 Dataset Description

The dataset includes the following key fields:

- **Year & Month** – Time-based analysis
- **Date** – Transaction-level data
- **Car Model** – Different car brands/models
- **Dealer ID** – Sales distribution across dealers
- **Quantity Sold** – Total units sold
- **Profit** – Revenue generated from sales

⚙️ Tools & Techniques Used

- Microsoft Excel
- Pivot Tables
- Data Cleaning & Transformation
- Data Visualization (Charts, Graphs, Dashboards)

📈 Key Insights & Analysis

🔷 Overall Performance

- **Total Units Sold:** 21,597 cars
- **Total Profit Generated:** ₹2,99,68,866+
- Data spans across **2 years** and **5 car models**

💠 Top Performing Model

- **Hudson** emerged as the **best-selling car model** based on total quantity sold.
- Indicates strong customer preference and high demand.

💠 Time-Based Trends

- Sales show **monthly fluctuations**, indicating:
    - Seasonal demand patterns
    - Potential peak sales periods
- Some months significantly outperform others, which can help in:
    - Inventory planning
    - Marketing campaign timing

💠 Dealer-Level Insights

- Performance varies across different dealers.
- Identifying **high-performing dealers** can help:
    - Replicate successful strategies
    - Improve low-performing regions

💠 Profit Analysis

- Profit does not always directly align with quantity sold.
- Some models generate **higher profit margins** despite lower sales volume.
- Helps in identifying **high-value products vs high-volume products**

📊 Dashboard Features

- Interactive Pivot Tables
- Sales trend charts (monthly/yearly)
- Model-wise performance comparison
- Profit distribution analysis

- Dealer performance breakdown

Business Impact

This analysis helps in:

- Improving **sales strategy**
- Identifying **high-demand car models**
- Optimizing **inventory and supply chain**
- Enhancing **profitability focus**
- Supporting **data-driven decision making**

Conclusion

This project demonstrates how Excel can be effectively used as a powerful data analysis tool to uncover insights and build business intelligence dashboards without advanced software.
